

Two-user egocentric QA generation pipeline

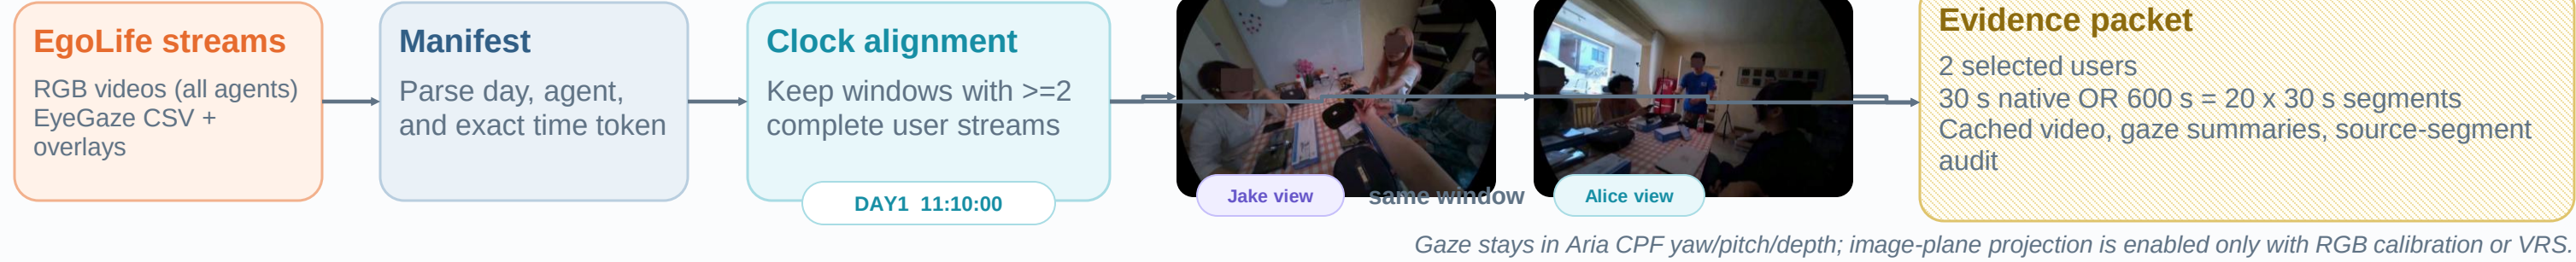

Synchronized streams -> CLIP-pruned generator media -> full-video verification -> auditable QA

BASELINE PRODUCTION

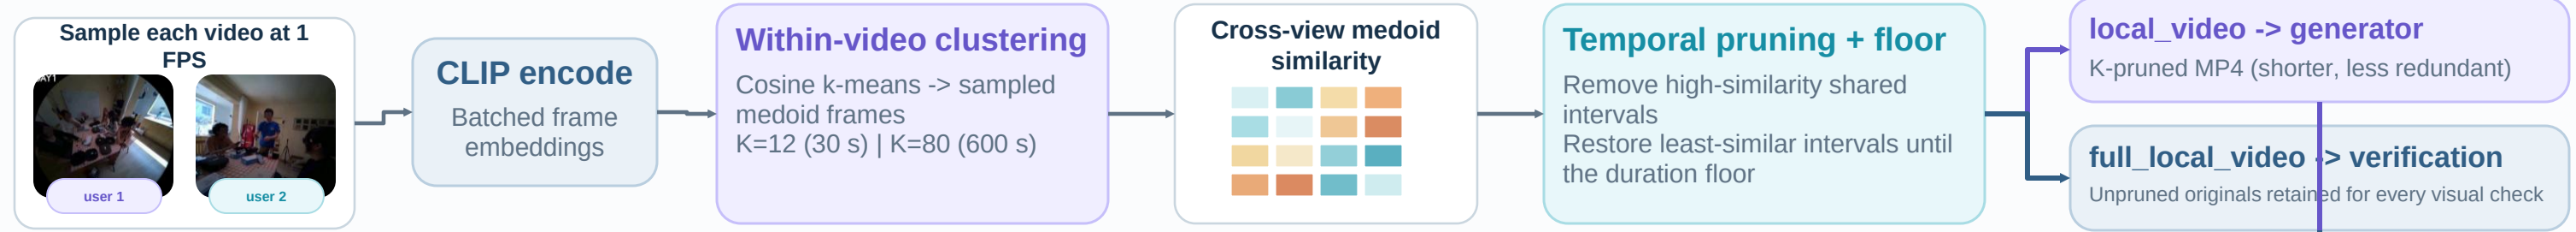

pruned media
full originals

retry feedback

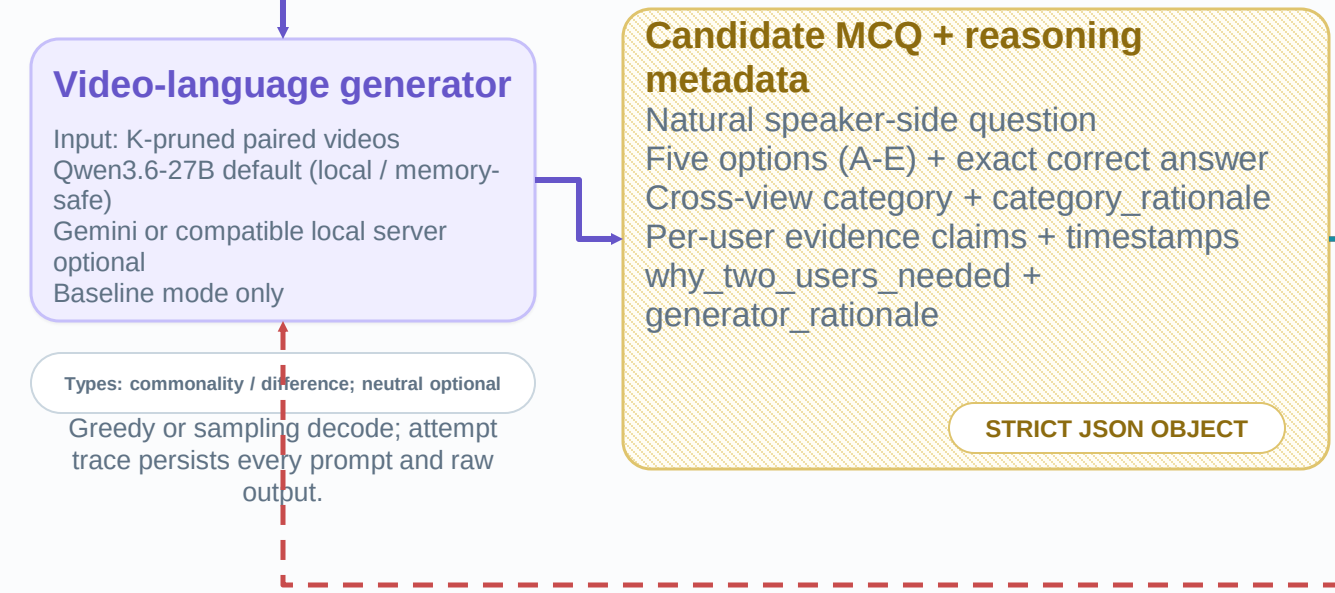

1 Build synchronized multi-user evidence

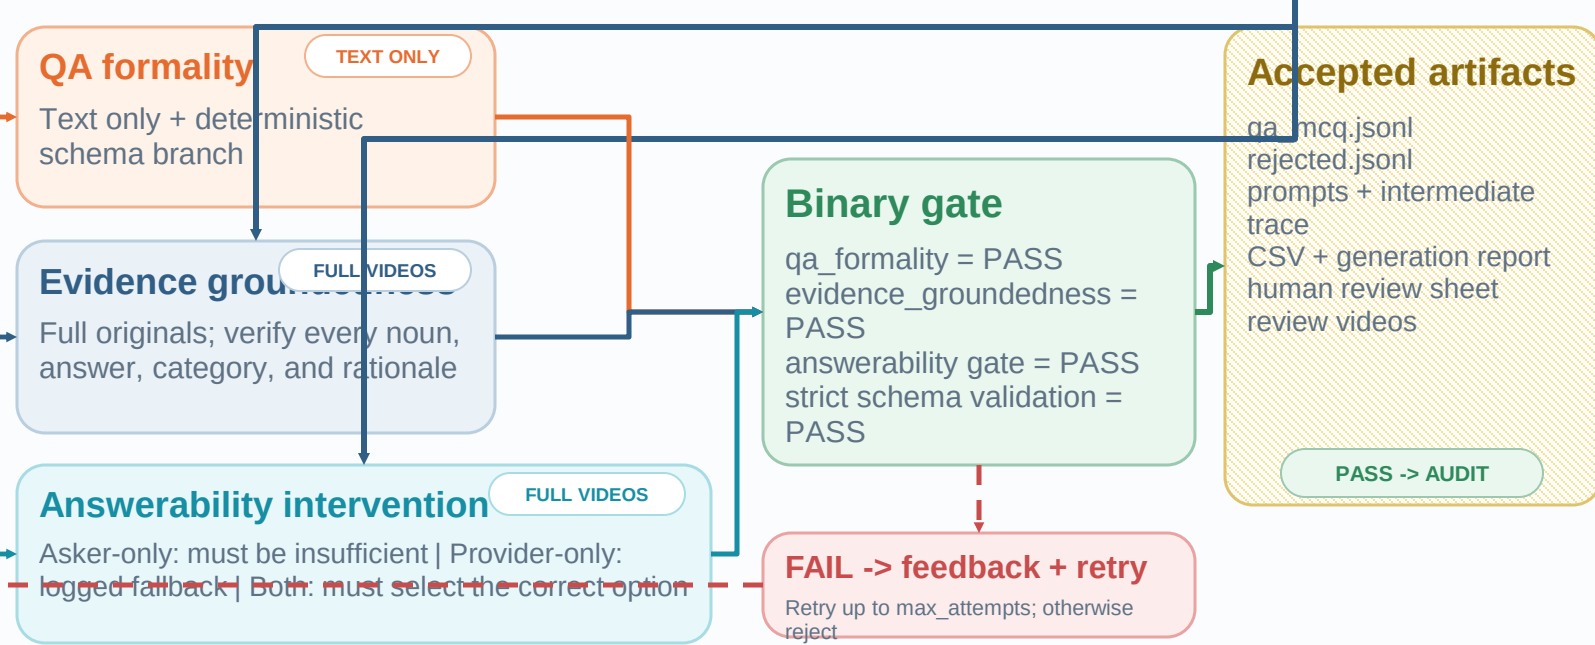

2 Prune redundant visual intervals and preserve full originals

3 Generate a situated two-user MCQ

4 Verify in parallel, gate, and retry

Audit and controlled experiments

Off the acceptance path: pruning K-grid with medoid/cluster traces + review.html | generator-rationale paired ablation | manual video review. Archived discovery / clip-guided modes and entropy scoring are not production gates.

Pruning illustration: what stays, what goes

Real fixed-pair K=12 run: DAY1 12:16:00, A4 Lucia + A6 Shure
